

THE FIRST SUCCESS OF 2018, PAVING THE ROAD FOR FURTHER INTERNATIONALISATION

Carbonitalia is a supplier of activated carbons and bleaching earths, based in La Spezia, Italy and a branch office of the worldwide logistics provider U. Del Corona & Scardigli, based in Livorno.

Carbonitalia's products are applicable for a myriad of applications in the Food & Beverage-, Chemical- and the Pharmaceutical industry, as well for the production of (ultrapure) water and for battling environmental issues (both water- and gas/air treatment).

During the first quarter of 2018, CARBONITALIA achieved important goals in all sectors.

Carbonitalia started a partnership with S.I.C.A.V. S.r.l. of Gissi (Chieti), winning an important tender for the supply of both virgin and regenerated activated carbon, applied for groundwater- and gaseous emission control treatment.

These particular contaminations- that will be purified by Carbonitalia's FILTERCARB activated carbon series- are originating from several different industrial plants, located throughout Italy.

Furthermore, Carbonitalia renewed the partnership agreement with Yuanli Active Carbon Ltd group and the joint objective is to increase the speed-up of the internationalization of both companies within the activated carbon market.

Yuanli Active Carbon is a world leader for the production of a brand-new, next generation of activated carbons, made from sustainable and renewable raw materials that are activated by an ultramodern high-end technology.

The agreement has been signed in the Yuanli Active Carbon headquarter of Nanping, capital of Fujian province of China on March, the 1st of 2018.

Management of both companies are extremely satisfied to continue the cooperation, which was based on the extension of the original agreement.

Yuanli Activated Carbon's next generation activated carbons product line, combined with Carbonitalia's technical- and market expertise, creates a winning and attractive combination for all end-users in the market.

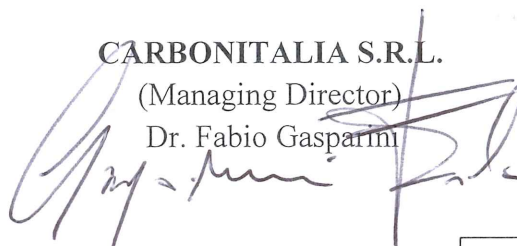

End-users of activated carbon are particularly interested in the next generation activated carbons because of the better performance, an ever-increasing awareness towards new innovations and due stricter guidelines in order to (better) protect the human health.
